

Efficiency and Control for Front Office Business Technical and IT Managers.

kACE Environment

- kACE offers absolute flexibility and independence.
- A complete suite of decision support analytics for the trading operations.
- A single environment in which to run all trading room analytics.
- A fast track development for bespoke analytics.
- Easy management of analytics models, displays and source data.
- An environment in which desktop requirements are easily customised to meet individual requirements.
- An architecture which is truly configurable and scalable ensuring performance and resilience.
- No longer are you reliant on external application providers to make changes.
- No more multiple spreadsheets that are variants of a single spreadsheet – simply upload them into kACE for control and transparency.

Efficiency and Control for business technical and IT

KACE provides banks, brokers and other financial institutions with a single calculation platform across the maximum number of instruments. All traders' calculations are distributed in a way that ensures the pricing and valuation standards are consistent across the enterprise.

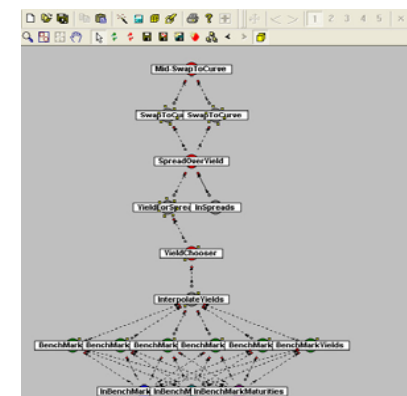

By replacing multiple stand-alone applications with a single integrated platform, overlapping functionality and a whole level of support costs, are removed. With one system to maintain and no requirement for heavy communications or expensive hardware, KACE effects cost savings across the board.

KACE advanced networking capabilities means that any calculation or view created by one trader can be delivered to any other workstation in your organisation. While users can take the information, manipulate it and incorporate it into their own calculations, overall control is maintained.

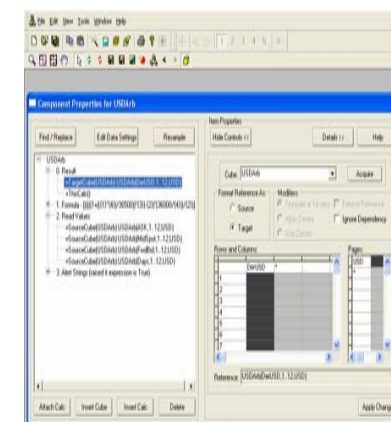

Assured Performance and Flexibility

KACE calculation database provides access to the world's leading maths libraries and the complete spectrum of industry standard calculations required to price foreign exchange, fixed income, money markets and all other off-balance sheet products. In addition, KACE has a unique design structure that enables the integration of an institution's proprietary functions and calculations into the global database.

KACE supports most industry platforms, as well as bespoke platforms, including Reuters RT/PTW/Triarch/SSL/RMDS, Tibco, Telerate, Bloomberg and many others.
